# Adverse Selection

- $0, \pi_1, \pi_2, \pi_3, \pi_e, \dots, \pi_7, \pi_8, \dots, \pi_n, 1.$

# Adverse Selection

- $0, \pi_1, \pi_2, \pi_3, \pi_e, \dots, \pi_7, \pi_8, \dots, \pi_n, 1.$

## Original definition

Purchasing decision is positively correlated with losses  
-Chiappori and Salanie (2000) “Positive Correlation Test”

# Adverse Selection

- $0, \pi_1, \pi_2, \pi_3, \pi_e, \dots, \pi_7, \pi_8, \dots, \pi_n, 1$ .

## Original definition

Purchasing decision is positively correlated with losses  
-Chiappori and Salanie (2000) “Positive Correlation Test”

- Empirical results are mixed and vary by market.

# Adverse Selection

- $0, \pi_1, \pi_2, \pi_3, \pi_e, \dots, \pi_7, \pi_8, \dots, \pi_n, 1$ .

## Original definition

Purchasing decision is positively correlated with losses  
 -Chiappori and Salanie (2000) “Positive Correlation Test”

- Empirical results are mixed and vary by market.

Life Insurance	Cawley and Philipson (1999)	X
Auto Insurance	Chiappori and Salanie (2000)	X
	Cohen (2005)	O
Annuity	Finkelstein and Poterba (2004)	O
Health Insurance	Cardon and Hendel (2001)	X

# Adverse Selection

- Restricting risk classification  $\Rightarrow$  Policy is over-subscribed by high risks **BAD?**

# Adverse Selection

- Restricting risk classification  $\Rightarrow$  Policy is over-subscribed by high risks **BAD?**
- **Good measurement?**

# Adverse Selection

- Restricting risk classification  $\Rightarrow$  Policy is over-subscribed by high risks **BAD?**
- **Good measurement?**
- Model:

$$S = \frac{E[QL]}{E[Q]E[L]} = \frac{\text{pooled premium } \pi_e}{\text{population-weighted fair premium}} \quad (1)$$

where

$Q$  : quantity of insurance

$L$  : risk experience .

# Adverse Selection

- Restricting risk classification  $\Rightarrow$  Policy is over-subscribed by high risks **BAD?**
- **Good measurement?**
- Model:

$$S = \frac{E[QL]}{E[Q]E[L]} = \frac{\text{pooled premium } \pi_e}{\text{population-weighted fair premium}} \quad (1)$$

where

$Q$  : quantity of insurance

$L$  : risk experience .

- **$S > 1 \Rightarrow$  Adverse Selection.**

# Example

## Example

- A population of 1000
- Two risk groups
  - ▶ 200 high risks with risk 0.04
  - ▶ 800 low risks with risk 0.01
- No moral hazard

# Example

No restriction on risk classification

# Example

No restriction on risk classification

Table 1	Low risk-group	High risk-group
Population	800	200
Risk	0.01	0.04
Break-even premium ( <b>fair premium</b> )	0.01	0.04
Number insured	400	100
Adverse Selection	1	

# Example

No restriction on risk classification

Table 1	Low risk-group	High risk-group
Population	800	200
Risk	0.01	0.04
Break-even premium ( <b>fair premium</b> )	0.01	0.04
Number insured	400	100
Adverse Selection	1	

**No adverse selection.**

# Example

## Restriction on risk classification-Case 1

Risk	0.01	0.04
Break-even premium ( <b>pooled premium</b> $\pi_e$ )	0.02154	
Number insured	200(400)	125(100)
Adverse Selection	<b>1.3462 &gt; 1</b>	

### Heavier adverse selection

**Adverse selection suggests pooling is always bad. But is it?**

# Table of contents

# Loss Coverage

# Loss Coverage

- Aim of insurance: provide protection for those who suffer losses.

# Loss Coverage

- Aim of insurance: provide protection for those who suffer losses.
  - ▶ High risks most need insurance.
  - ▶ Restriction on risk classification seems reasonable.

# Loss Coverage

- Aim of insurance: provide protection for those who suffer losses.
  - ▶ High risks most need insurance.
  - ▶ Restriction on risk classification seems reasonable.
- Thomas (2008, 2009) “**Loss Coverage**”:

# Loss Coverage

- Aim of insurance: provide protection for those who suffer losses.
  - ▶ High risks most need insurance.
  - ▶ Restriction on risk classification seems reasonable.
- Thomas (2008, 2009) “**Loss Coverage**”:

## Definition

$$\text{Loss Coverage} = \frac{\text{insured expected losses}}{\text{population expected losses}}$$

# Loss Coverage

- Aim of insurance: provide protection for those who suffer losses.
  - ▶ High risks most need insurance.
  - ▶ Restriction on risk classification seems reasonable.
- Thomas (2008, 2009) “**Loss Coverage**”:

## Definition

$$\begin{aligned} \text{Loss Coverage} &= \frac{\text{insured expected losses}}{\text{population expected losses}} \\ \text{Loss Coverage Ratio} &= \frac{\text{loss coverage at a pooled premium } \pi_e}{\text{loss coverage at at fair premium } \pi_i} \\ &> 1, \text{ **Favorable!**} \end{aligned}$$

# Example

No restriction on risk classification

# Example

# Demand Functions

## Definition

The demand function  $d(\mu, \pi)$  is the demand of a single individual with risk  $\mu$ , will buy insurance at premium  $\pi$ .

# Demand Functions

## Definition

The demand function  $d(\mu, \pi)$  is the demand of a single individual with risk  $\mu$ , will buy insurance at premium  $\pi$ .

It is assumed to have the following properties:

- $\frac{\partial}{\partial \pi} d(\mu, \pi) < 0 \Rightarrow$  demand is a decreasing function of premium.

# Demand Functions

## Definition

The demand function  $d(\mu, \pi)$  is the demand of a single individual with risk  $\mu$ , will buy insurance at premium  $\pi$ .

It is assumed to have the following properties:

- $\frac{\partial}{\partial \pi} d(\mu, \pi) < 0 \Rightarrow$  demand is a decreasing function of premium.
- $\frac{\partial^2}{\partial \pi^2} d(\mu, \pi) > 0 \Rightarrow$  a decreasing rate of fall in demand as premium increases.

# Demand Functions

## Definition

The demand function  $d(\mu, \pi)$  is the demand of a single individual with risk  $\mu$ , will buy insurance at premium  $\pi$ .

It is assumed to have the following properties:

- $\frac{\partial}{\partial \pi} d(\mu, \pi) < 0 \Rightarrow$  demand is a decreasing function of premium.
- $\frac{\partial^2}{\partial \pi^2} d(\mu, \pi) > 0 \Rightarrow$  a decreasing rate of fall in demand as premium increases.

## Definition

The demand elasticity  $\epsilon(\mu, \pi) = -\frac{\partial d(\mu, \pi)}{d(\mu, \pi)} / \frac{\partial \pi}{\pi}$  i.e. sensitivity of demand to premium changes.

# Demand Functions

## Iso-elastic demand

$$d(\mu, \pi) = \tau \left[ \frac{\pi}{\mu} \right]^{-\lambda}$$
$$\epsilon(\mu, \pi) = \lambda$$

## Negative-exponential demand

$$d(\mu, \pi) = \tau e^{(1 - \frac{\pi}{\mu})\lambda}$$
$$\epsilon(\mu, \pi) = \frac{\lambda}{\mu} \pi$$

# Equilibrium Premium

# Equilibrium Premium

$$f(\pi_e) = E[\text{Total Profit}] = 0$$

# Equilibrium Premium

$$f(\pi_e) = E[\text{Total Profit}] = 0$$

For two risk-groups,

$$f(\pi_e) = d(\mu_1, \pi_e)p_1(\pi_e - \mu_1) + d(\mu_2, \pi_e)p_2(\pi_e - \mu_2) = 0. \quad (2)$$

# Equilibrium Premium

$$f(\pi_e) = E[\text{Total Profit}] = 0$$

For two risk-groups,

$$f(\pi_e) = d(\mu_1, \pi_e)p_1(\pi_e - \mu_1) + d(\mu_2, \pi_e)p_2(\pi_e - \mu_2) = 0. \quad (2)$$

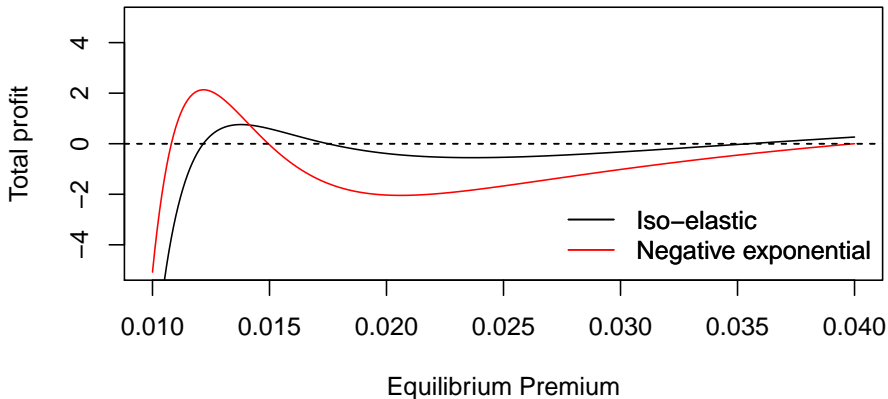

Equilibrium Premium

# Multiple Equilibria

Only for extreme parameter values. E.g.

$p_1 = 9000, \tau_1 = 1, \mu_1 = 0.01, \lambda_1 = 5; p_2 = 80, \tau_2 = 1, \mu_2 = 0.04, \lambda_2 = 1$

# Multiple Equilibria

## Theorem

Given  $(\mu_1, \mu_2)$ ,  $(\tau_1, \tau_2)$  and  $(\lambda_1, \lambda_2)$ , there are **multiple equilibria** if and only if  $c < c_1$  and  $\alpha(\pi_{01}) \leq \alpha \leq \alpha(\pi_{02})$ .

Where

- $\alpha = \frac{p_1}{p_2}$ .
- $\pi_{01}, \pi_{02}$  are solutions to  $f(\pi_e) = 0, f'(\pi_e) \leq 0$ .

# Multiple Equilibria

## Theorem

Given  $(\mu_1, \mu_2)$ ,  $(\tau_1, \tau_2)$  and  $(\lambda_1, \lambda_2)$ , there are **multiple equilibria** if and only if  $c < c_1$  and  $\alpha(\pi_{01}) \leq \alpha \leq \alpha(\pi_{02})$ .

Where

- $\alpha = \frac{p_1}{p_2}$ .
- $\pi_{01}, \pi_{02}$  are solutions to  $f(\pi_e) = 0, f'(\pi_e) \leq 0$ .

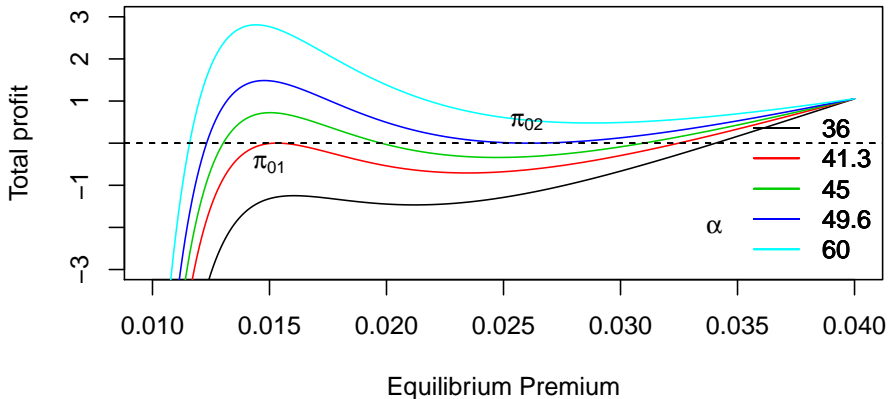

For iso-elastic demand,  $c = \lambda_2 - \lambda_1, c_1 = -\frac{\sqrt{\mu_1} + \sqrt{\mu_2}}{\sqrt{\mu_2} - \sqrt{\mu_1}} < 0$ .

For negative-exponential demand,  $c = \frac{\lambda_2}{\mu_2} - \frac{\lambda_1}{\mu_1}, c_1 = -\frac{4}{\mu_2 - \mu_1} < 0$ .

# Example: Iso-elastic demand

$$\mu_1 = 0.01, \mu_2 = 0.04 \Rightarrow c_1 = -3;$$

$$\lambda_1 = 4, \lambda_2 = 0.5 \Rightarrow c = -3.5 < c_1$$

# Example: Negative-exponential demand

$$\mu_1 = 0.01, \mu_2 = 0.04 \Rightarrow c_1 = -133.33 :$$

$$\lambda_1 = 2, \lambda_2 = 0.5 \Rightarrow c = -187.5 < c_1$$

# Results

## Assumptions

- There are 2 risk-groups
- They have equal demand elasticities -> **Unique Equilibrium**
  - ▶ Iso-elastic demand:  $\lambda_1 = \lambda_2 = \epsilon(\pi_e)$
  - ▶ Negative-exponential demand:  $\frac{\lambda_1}{\mu_2} \pi_e = \frac{\lambda_2}{\mu_2} \pi_e = \epsilon(\pi_e)$

# Results: Adverse Selection

$$p_1 = 9000, \tau_1 = 1, \mu_1 = 0.01; p_2 = 1000, \tau_2 = 1, \mu_2 = 0.04$$

# Results: Loss Coverage

$$p_1 = 9000, \tau_1 = 1, \mu_1 = 0.01; p_2 = 1000, \tau_2 = 1, \mu_2 = 0.04$$

# Summary

# Summary

- When there is restriction on risk classification, a **pooled premium**  $\pi_e$  is charged across all risk-groups.

# Summary

- When there is restriction on risk classification, a **pooled premium**  $\pi_e$  is charged across all risk-groups.
- There will always be adverse selection  $\Rightarrow$  Adverse Selection may not be a good measurement.

# Summary

- When there is restriction on risk classification, a **pooled premium**  $\pi_e$  is charged across all risk-groups.
- There will always be adverse selection  $\Rightarrow$  Adverse Selection may not be a good measurement.
- Loss Coverage is an alternative metric.

# Summary

- When there is restriction on risk classification, a **pooled premium**  $\pi_e$  is charged across all risk-groups.
- There will always be adverse selection  $\Rightarrow$  Adverse Selection may not be a good measurement.
- Loss Coverage is an alternative metric.  
Using iso-elastic and negative-exponential demand,

# Summary

- When there is restriction on risk classification, a **pooled premium**  $\pi_e$  is charged across all risk-groups.
- There will always be adverse selection  $\Rightarrow$  Adverse Selection may not be a good measurement.
- Loss Coverage is an alternative metric.  
Using iso-elastic and negative-exponential demand,
- **Adverse Selection is not always a bad thing!**  
**A moderate level of adverse selection can increase loss coverage.**

# Further Research

- Other/more general demand e.g.  $d(\mu, \pi) = \tau e^{1 - (\frac{\pi}{\mu})^\lambda}$ .
- Loose restriction on demand elasticities.
- Partial restriction on risk classification.
